Object-oriented JavaScript Lab

At this point, you probably have a file called romanNumeral.js with an exported function called 'convert'. Let's convert that to a class called RomanNumeralConvertor and see if you like it better.

- First, change your tests. Wherever you're calling convert, change the "convert" to
 "convertor.convert". Then, instantiate what will become your class like so:
 const convertor = new RomanNumeralConvertor();
- 2. Find all the places that you're importing convert. You'll want to change those to import RomanNumeralConvertor instead.

Your tests will fail because RomanNumeralConvertor isn't defined. Let's fix that.

- 3. Open romanNumeral.js in your IDE. Wrap your function in a class. You'll have to change the syntax to make it work. You may have to remove the function keyword among other things.
- 4. Don't forget to change your export. You're no longer exporting the function. You now want to export the entire class.
- 5. At this point, your tests should pass. Go ahead and run them. If they don't pass, work with them until they do.

Using class accessors

convertor.romanNumeral = "xiv";

Let's say that we were told our convert function is difficult to use and that it would be easier if someone could do it like this:

```
const decimalNumber = convertor.decimalNumber;
console.log(decimalNumber);  // Should say "14"

We can make that happen!

6. Write a new test. Something like this will do:
   it("should convert roman to decimal using a setter and getter", () => {
    const convertor = new RomanNumeralConvertor();
    convertor.romanNumeral = "iii";
    expect(convertor.decimalNumber).toEqual(3);
});
```

- 7. That test will fail if you try it.
- 8. Bonus! Write 3-4 tests right now for roman numerals that you think will work in your convertor.

Writing the accessors

```
9. First create two properties called _decimalNumber and _romanNumeral.
10. Next create a getter for decimalNumber kind of like this:
get decimalNumber() {
    return this._decimalNumber;
}
11. Then do the same for a getter for romanNumeral.
12. Create a setter for romanNumeral something like this:
set romanNumeral(value) {
    this._romanNumeral = value;
    this._decimalNumber = this.convert(value);
}
13. At this point, you've created enough to get your tests to pass. Work with them until they do.
```
